

GLA UNIVERSITY

Department of Computer Engineering & Applications

MINI PROJECT – 1 SYNOPSIS

1. BASIC PROJECT DETAILS

Project Title	Symptom Intake & Triage Experience
Batch No.	Batch 1
Section	3GA
Semester	V
Date of Submission	17-10-2026
Faculty Mentor / Guide	Anurag Das

2. TEAM MEMBERS & ROLES

List every team member, their university roll number, and their specific role/responsibility in the project (e.g., Frontend Development, UI/UX Design, Backend & API, Testing & Documentation, Research & Presentation).

S.No.	Name of Student	University Roll No.	Role in Project
1	AKASH SINGH	2415000151	Frontend Development & Decision Logic
2	AMRENDRA SINGH	2415000196	Local storage, Usage and Data handling
3	ANSH VISHWAKARMA	2415000259	UI/UX Design & State Architecture
4	ARHAM ZABI	2415000319	Animations & Confidence Indicators
5	DEVANSH VARSHNEY	2415000510	Research, Testing & Documentation

3. PROJECT DESCRIPTION

Briefly describe what the project is about — the problem it addresses and the core idea behind it (150–200 words).

This project develops a purely client-side web platform designed to streamline medical intake and preliminary symptom assessment. Traditional online symptom-checkers often depend on continuous server communication, introducing latency and responsiveness issues during critical triage evaluations.

To overcome this, our system executes the entire branching questionnaire and decision-tree logic directly within the user's browser. As users navigate through dynamic health questions, the application evaluates risk factors in real time without backend calls, offering immediate triage recommendations. Additionally, the system provides a visual path tracking how inputs influence outcomes, dynamically animated confidence meters, and a clinician-facing screen to review flagged cases from a locally held queue.

4. OBJECTIVES & PROPOSED WORK (WHAT WE ARE GOING TO DO)

Explain the key features you plan to build, the technology/approach you will use, and the current stage of work. Use bullet points if needed.

- **Branching Questionnaire Engine:** Build a client-rendered decision tree in JavaScript/React that routes users through relevant health questions based on real-time selections.
- **Instant Triage Generation:** Compute medical urgency indicators instantly in the browser without server latency.
Visual Decision Path: Create an interactive UI component that displays the complete reasoning path taken by the patient during the intake journey.
- **Animated Indicators:** Implement smooth CSS/JS animations to represent confidence levels and severity scores dynamically.
- **Clinician Review Queue:** Implement a local storage-backed dashboard allowing medical personnel to filter and review flagged patient cases.
- **Current Stage of Work:** UI layout design, state architecture planning, and decision tree logic mapping are currently in progress.

5. FUTURE SCOPE / ENHANCEMENTS

Describe what you plan to add or improve in the future beyond the current scope of the project.

- **Backend & Cloud Integration:** Connect the local triage engine to a secure, HIPAA-compliant server for permanent patient record storage.
- **AI/ML Diagnostic Assistance:** Incorporate trained machine learning models to improve diagnostic accuracy beyond static decision trees.
- **Multi-Language Accessibility:** Support multiple regional languages to cater to a broader patient demographic.
PDF Report Export: Enable patients to download or email structured summary reports directly to their primary healthcare providers.

6. TOOLS & TECHNOLOGIES USED

Frontend Framework: React.js, HTML5, CSS3, JavaScript (ES6+)

UI & Animation: Tailwind CSS, Framer Motion

State Management & Storage: React Context API / Redux, LocalStorage / IndexedDB **Development & Version Control:** VS Code, Git, GitHub

7. EXPECTED OUTCOME

Summarize the expected result/deliverable of the project.

- A fully functional, highly responsive single-page web application running completely in the client browser.
- Zero-delay symptom evaluation with interactive visual progress maps and animated confidence meters.
- A working clinician dashboard to effectively view and triage flagged patient cases stored locally.
